

Healthy average life expectancy (HALE) in Angola

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (27.7/100), population in Angola had 55.8 years as HALE in 2016. That represents an increase of about four (4) years compared to the value of 2010. In the period 2000-2016, HALE in Angola seems to increase by about one (1) each every 2 years. In Angola, women expect to live at least 3 years longer in "full health" than men (in the period 2000-2016).

Angola was ranked 21 st out of 47 about HALE in the WHO African Region in 2016. However, compared to its neighbors, Angola ranked third behind the Republic of Congo (56.7) and Namibia (55.9) in terms of HALE in 2016.
