

Healthy average life expectancy (HALE) in Malawi

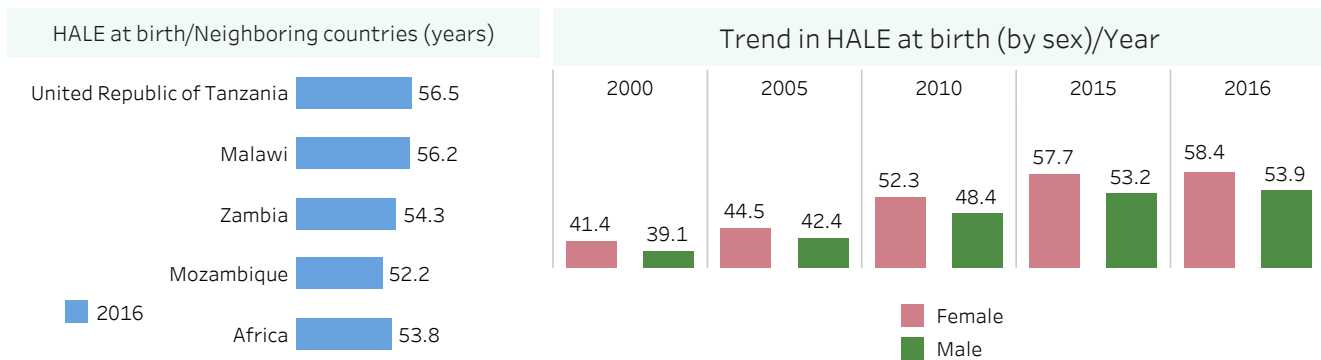

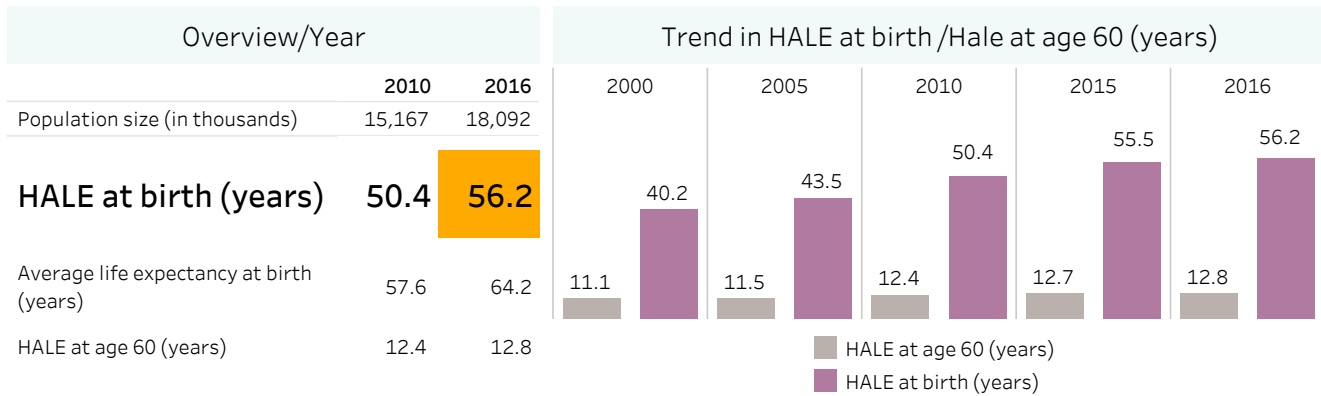

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (45.9/100), population in Malawi expected to live in average 56.2 years in "full health" in 2016. That represents an increase of about 6 years compared to the value of 2010. Over the period 2000-2016, HALE in Malawi seems to increase by about 1 year each every 1 year.

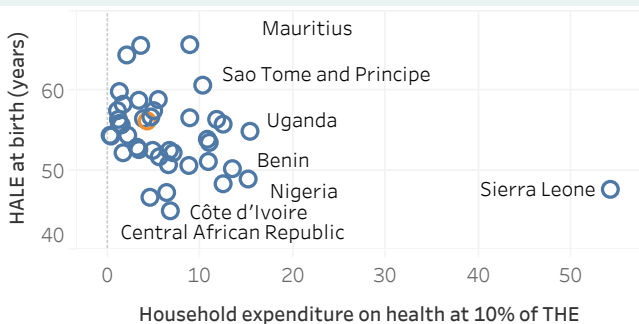

In Malawi, women seem to live in "full health" 4 years longer than men (over the period 2010-2016).

Malawi was ranked 19th out of 47 for HALE in the African region in 2016. However, compared to its neighbors, Malawi was ranked second behind United Republic of Tanzania (56.5 years) and ahead of Zambia (54.3 years) and Mozambique (52.2 years).
