

Healthy average life expectancy (HALE) in Seychelles

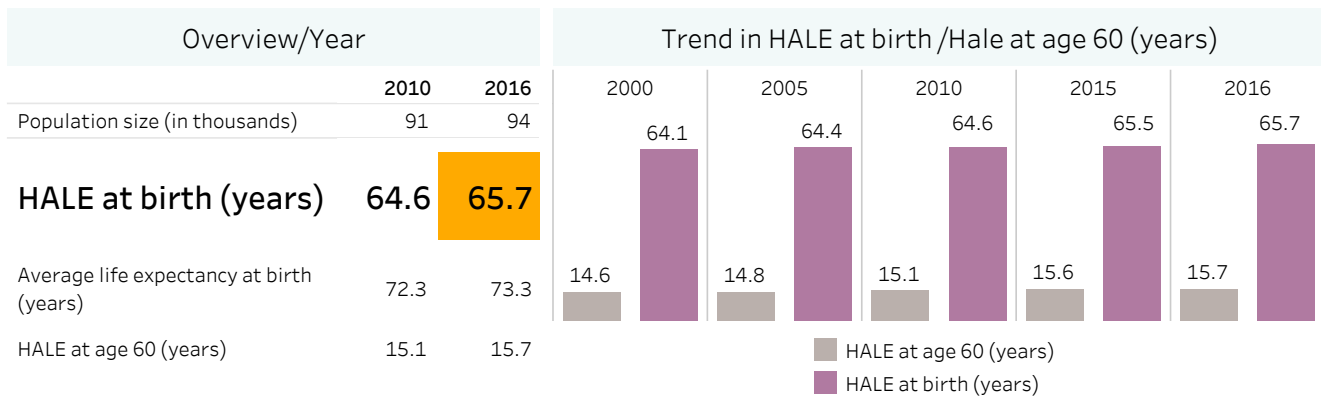

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (71/100), population in Seychelles expected to live in average 65.7 years in "full health" in 2016. That represents an increase of about 1 year compared to the value of 2010. Over the period 2000-2016, HALE in Seychelles seems to increase by about 1 year each every 10 years.

In Seychelles, women seem to live in "full health" seven (7) years longer than men (over the period 2000-2016).

Seychelles was ranked 2nd out of 47 for HALE in the African region in 2016. However, compared to its neighbors, Seychelles was first behind Kenya (58.9 years), Madagascar (58.3 years) and Comoros (56.6 years).
