

Healthy average life expectancy (HALE) in Zimbabwe

Healthy average life expectancy (HALE) at birth is the average number of years that a person can expect to live in "full health" by taking into account years lived in less than full health due to disease and/or injury. HALE adds up expectation of life for different health states, adjusted for severity distribution making it sensitive to changes over time or differences between countries in the severity distribution of health states.

With a weak service coverage index (54.4/100), population in Zimbabwe expected to live in average 54.4 years in "full health" in 2016. That represents an increase of about 7.7 years compared to the value of 2010. Over the period 2000-2016, HALE in Zimbabwe seems to increase by about 8.5 years each every 10 years.

In Zimbabwe, women seem to live in "full health" 3 years longer than men (over the period 2015-2016).

Zimbabwe was ranked 25nd out of 47 for HALE in the African region in 2016. However, compared to its neighbors, Zimbabwe was 3rd behind Botswana (57.5 years) and South Africa (55.7 years).
